

Proposal in Response to RFP-2026-DATA660

Enterprise Data Warehouse

Submitted by **Aventra Software Group** — Data & Analytics

Prepared for **Riverside Health Partners**

RFP reference	RFP-2026-DATA660
Submitted	July 15, 2026
Vendor	Aventra Software Group
Contact	proposals@aventrasoftware.example · (512) 555-0182
Proposed fee	\$600,000 (fixed price)
Proposed duration	9 months

Sample document. This proposal is fictional and was generated for demonstration purposes. The vendor, prices, team, and all details are invented.

1. Cover letter

July 15, 2026

Denise Park, Procurement Manager
Riverside Health Partners

Dear Denise Park,

Thank you for the opportunity to respond to RFP-2026-DATA660 for **Enterprise Data Warehouse**. Aventura Software Group has designed, built, and operated custom software for mid-market and enterprise organizations since 2009, delivering more than 300 engagements across healthcare, government, education, financial services, and manufacturing. We specialize in modernizing legacy systems, unifying fragmented data, and shipping applications that teams adopt without a fight.

We have structured this proposal to address each of your requirements directly. The fixed price quoted is **\$600,000**, within your stated budget. This proposal is valid for 90 days.

Sincerely,

Priya Raman

Engagement Director, Aventura Software Group

2. Executive summary

Aventura Software Group proposes to deliver **Enterprise Data Warehouse** for Riverside Health Partners — consolidation of data from multiple source systems into a governed cloud data warehouse with a documented, trustworthy data model. We will deliver in **9 months** for a **fixed fee of \$600,000**, meeting your **SOC 2, data-governance and retention policies** requirements.

3. Understanding of your needs

Your data is spread across many systems, reporting is slow and manual, and teams argue about whose numbers are right. You need one governed source of truth.

4. Proposed solution

We will build a cloud-native data warehouse fed by automated pipelines from your source systems, on a documented and governed data model with role-based access and data-quality monitoring — the trustworthy foundation for reporting, analytics, and AI.

The solution provides the following capabilities:

- Automated data pipelines from all major source systems
- Governed, documented data model and definitions
- Role-based access to sensitive data
- Data-quality monitoring and alerting
- Historical and point-in-time reporting
- Foundation for BI, analytics, and AI

Integrations

- Integration with each core operational system via documented, versioned APIs.
- Integration with the identity provider (SSO) via documented, versioned APIs.
- Integration with the BI / dashboard tool via documented, versioned APIs.

5. Technical approach

Methodology. We deliver in short, fixed-length sprints, each ending with a working, demonstrable increment and a stakeholder review. Every engagement begins with a fixed-scope discovery sprint that confirms requirements, design, and a detailed plan before any build commitment, so scope and pricing reflect a shared understanding of the work.

Hosting. Solutions are cloud-hosted on AWS, Azure, or GCP (your choice), deployed with infrastructure-as-code so environments are reproducible and auditable. We target 99.9% uptime during business hours, with automated backups and a documented recovery objective. You retain ownership of the cloud accounts and all infrastructure code.

Security. Security is reviewed every sprint, not bolted on before launch. All data is encrypted in transit (TLS 1.2+) and at rest (AES-256), privileged access requires multi-factor authentication, and security-relevant events are audit-logged with retention. We follow a secure SDLC with mandatory code review, run annual third-party penetration tests, and maintain a documented vulnerability-management and patching process. Aventura is SOC 2 Type II and ISO/IEC 27001:2022 aligned.

Authentication. We integrate with your existing identity provider using SAML 2.0 or OpenID Connect for single sign-on, with role-based access control and least-privilege defaults. Multi-factor authentication is enforced for privileged accounts.

Integration. Each integration is delivered through documented, versioned REST APIs with a clear contract and explicit error handling. We prove every integration end-to-end in a test environment before it reaches production, and we document assumptions and data mappings for each connected system.

Quality assurance. Quality is built in: automated tests run in CI on every change, all code is peer reviewed, and each release passes a security review before go-live. We support a formal user-acceptance testing phase with your team and track defects to closure against agreed severity and response targets.

Accessibility. All user interfaces are designed and tested to WCAG 2.1 AA (and Section 508 where applicable). Accessibility is validated each sprint with automated tooling and manual screen-reader testing, not deferred to a pre-

launch audit.

6. Project plan and timeline

We will deliver in five phases over **9 months**, each ending with a working, demonstrable increment and a stakeholder review:

Phase	Timeline
Discovery & Design	Months 1–2
Foundation & Integrations	Months 3–4
Core Build	Months 5–7
Testing & Hardening	Month 8
Launch & Stabilization	Month 9

7. Project team

We staff dedicated delivery pods — the people who scope your project are the people who build it. Proposed key personnel:

Name	Role	Focus
Priya Raman	Engagement Director	single point of accountability for the program
Marcus Bell	Solution Architect	owns the architecture and integration approach
Elena Duarte	Lead Engineer	owns technical delivery and code quality
Sofia Nguyen	UX Designer	runs user research and accessible interface design
David Okafor	Project Manager	your point of contact for schedule, scope, and status
Grace Kim	QA & Security Lead	owns test strategy and the pre-release security review

8. Relevant experience

Aventra Software Group has designed, built, and operated custom software for mid-market and enterprise organizations since 2009, delivering more than 300 engagements across healthcare, government, education, financial services, and manufacturing. We specialize in modernizing legacy systems, unifying fragmented data, and shipping applications that teams adopt without a fight. We will provide at least three references from comparable **Enterprise Data Warehouse** engagements, matched by industry and project type, on request.

9. Pricing

We propose a **fixed fee of \$600,000** (Fixed price by workstream, invoiced on milestones), within your estimated budget of \$300,000 – \$900,000.

Line item	Amount
Discovery & solution design	\$85,000
Development & configuration	\$250,000
Integrations	\$95,000
Data migration & setup	\$50,000
Quality assurance & security testing	\$60,000
Training, documentation & launch	\$35,000
Project management	\$25,000
Total (fixed price)	\$600,000

Pricing approach. We propose a fixed price against the scope confirmed in discovery, itemized by workstream, and invoiced on milestone completion. Change requests are handled through a lightweight change-control process so cost and scope stay aligned. Third-party license and hosting fees are called out separately and are not marked up.

10. Support and service levels

Every launch includes a defined post-launch care plan with a named support lead and tiered service levels: critical issues acknowledged within 1 business hour, high within 4, and standard within 1 business day. The care plan covers monitoring, patching, and enhancements, and is quoted separately as an optional, renewable service.

11. Why Aventura Software Group

Fixed-scope discovery before any build commitment; dedicated delivery pods where the people who scope your project are the people who build it; accessibility and security reviewed every sprint; and full handover of code, infrastructure, and documentation with a defined post-launch care plan. You are never locked in.

Specific to this offering:

- Governed, documented model — analysts trust the numbers
- Cloud-native warehouse scales without re-platforming

Certifications: SOC 2 Type II, ISO/IEC 27001:2022, HIPAA-aligned engineering practices, AWS Advanced Consulting Partner, Microsoft Solutions Partner (Digital & App Innovation).

12. Assumptions, exclusions, and risks

Our pricing assumes the scope described in the RFP, timely access to stakeholders and source/target systems, and availability of test environments at project start. Third-party licenses, ongoing hosting, and hardware are excluded from the fixed fee. Integration unknowns are surfaced early in discovery and managed through change control; a named support lead owns post-launch stability.
